### Compresión con gzip

Se utilizó "http://localhost:8080/api/randoms" para realizar la comparación.

Para la primera imagen no se aplicó compresión, se puede apreciar una diferencia de tamaño y tiempo de respuesta entre ambas solicitudes.

Al hacer uso de compresión, el tamaño se redujo en un 44% y el tiempo de respuesta en un 26%, demostrando que resulta bastante beneficioso el uso de este middleware.

# Test de carga con Artillery

```
JS server.js U
        ■ result_fork.txt U X
14-Loggers > artillery > ≡ result_cluster.txt
                            14-Loggers > artillery > ≡ result_fork.txt

```

A la izquierda tenemos los resultados del servidor en modo Cluster, y a la derecha en modo Fork. Los tiempos de respuesta del primero son en general más bajos que los del segundo, por lo que es posible concluir que el modo Cluster es el más eficiente de ambos.

#### Perfilamiento del servidor

Las siguientes pruebas se realizan sobre "localhost:8080/api/info", en modo fork, agregando o extrayendo un console.log de la información recolectada antes de devolverla al cliente.

# 1. --prof

```
rs > profiling > ≡ result_log.txt
                                      s > profiling > \ \ result_nolog.txt
                                      [Summary]:
[Summary]:
                                        ticks total nonlib name
 ticks total nonlib name
                                          49
                                               0.2% 100.0% JavaScript
   58 0.3% 100.0% JavaScript
                                               0.0% 0.0% C++
                                          0
    0 0.0% 0.0% C++
                                          51 0.2% 104.1% GC
        0.2% 75.9% GC
   44
                                       30153
                                              99.8%
                                                            Shared libraries
 20619 99.7%
                     Shared libraries
```

En el resumen, vemos que el proceso que hace uso de un console.log tiene menos ticks. Ambos archivos pueden ser encontrados en la carpeta del proyecto.

# 2. --inspect

Nuevamente, se puede apreciar que el proceso que hace uso de un console.log (izquierda), toma más tiempo para completarse.
